

### Running Arambam eCommerce:

1. Download the source code
2. Make sure there are .env files for all folders
3. Open terminal and install all dependencies for all folders. This can be done by opening and integrated terminal for each file and running “npm install”
4. Open the backend file and once all dependencies are installed to run it type “npm run server” in terminal and the backend is now ready.
5. Open the fronted file and once all dependencies are installed to run it type “npm run dev” in terminal and the frontend is now ready.
6. Open the admin file and once all dependencies are installed to run it type “npm run dev” in terminal and the admin is now ready.
7. MAKE SURE 1<sup>st</sup> THE BACKEND SERVER IS RUNNING FIRST OTHERWISE ADMIN AND FRONTEND WILL SHOW “NETWORK ERROR”
